

MongoDB vs SQL: The Developer's Cheat Sheet

1. Basic Administration

Create/Use Database: `use myDatabase`

Create Collection: `db.createCollection("users")`

2. Query Comparison Table

Operation	SQL	MongoDB
Select All	<code>SELECT * FROM users</code>	<code>db.users.find()</code>
Where Clause	<code>SELECT * FROM users WHERE age > 25</code>	<code>db.users.find({ age: { \$gt: 25 } })</code>
Order By	<code>SELECT * FROM users ORDER BY name ASC</code>	<code>db.users.find().sort({ name: 1 })</code>
Limit/Offset	<code>SELECT * FROM users LIMIT 5 OFFSET 10</code>	<code>db.users.find().limit(5).skip(10)</code>
Group By	<code>SELECT age, COUNT(*) FROM users GROUP BY age</code>	<code>db.users.aggregate([{\$group: {_id: "\$age", count: {\$sum: 1}}]})</code>

3. Relationships (Joins)

SQL uses `JOIN`, while MongoDB uses `$lookup` in the aggregation pipeline.

MongoDB \$lookup Example:

```
db.orders.aggregate([  
  $lookup: {  
    from: "users",  
    localField: "user_id",  
    foreignField: "_id",  
    as: "user_details"  
  }  
])
```
